

PRODUCT BACKLOG - SkyLens

EPIC 1: MVP - Identify the sky in real time

Epic Hypothesis: Casual users can identify celestial objects correctly within 30 seconds, without any prior astronomy knowledge, using only their phone's camera.

Success Metrics:

- $\geq 70\%$ of users complete their first identification within 2 minutes
 - $\geq 30\%$ of users return within 7 days
 - App store rating ≥ 4.0
-

Personas involved:

- Ana (casual user, curious about the night sky)
 - Rafael (amateur astronomy enthusiast)
 - Beatriz (science educator)
-

Feature: AR Sky Identification

Priority: High (foundation of the entire MVP)

[TASK] Integrate AR SDK with device sensors - Story Point Estimate: 5 pts

Configure the AR SDK (ARKit for iOS / ARCore for Android) and connect it with the device's orientation sensors (gyroscope, magnetometer) and GPS, establishing the technical foundation to overlay information on the camera image in real time.

Acceptance Criteria:

- AR SDK integrated and running on a physical device (not only emulator)
 - App captures device orientation (azimuth and altitude) with $\pm 5^\circ$ precision
 - GPS data (latitude/longitude) is correctly captured for celestial position calculation
 - Tested on at least 1 Android and 1 iOS device
-

[STORY] As Ana, a casual user, I want to point my phone's camera to the sky and see the celestial object identified - Story Point Estimate: 8 pts

As Ana (a casual user, curious about the night sky), I want to point my phone's camera to the sky and see the name of the celestial object overlaid on the screen, so that I can identify what I'm seeing without effort.

Depends on: "Integrate AR SDK with device sensors"

Acceptance Criteria:

- Given the app has camera and GPS access, when I point to a visible celestial object, then its name appears overlaid within 2 seconds
 - If no object is recognized, the app shows "No object identified here" instead of freezing or showing a blank screen
 - The overlaid text remains readable (adequate contrast) in both clear and dark sky
 - Tested with at least 3 different objects (e.g., Moon, Venus, a reference star)
-

[STORY] As Ana, a casual user, I want to grant camera and location permissions clearly - Story Point Estimate: 2 pts

As Ana (casual user, curious about the night sky), I want to grant camera and location permissions clearly, so that I understand why the app needs this access.

Acceptance Criteria:

- Permission screen explains in one sentence the reason for each permission (camera and location)
 - If permission is denied, the app guides the user on how to enable it later in settings
 - Flow tested in both scenarios: permission granted and permission denied
-

Feature: Object Info Sheet

Priority: High

[STORY] As Ana, a casual user, I want to view basic info about an identified celestial object - Story Point Estimate: 5 pts

As Ana (a casual user, curious about the night sky), I want to tap on the identified object's name to see a simple explanation about it, so that I can understand what I'm seeing beyond just the name.

Acceptance Criteria:

- Info sheet displays: name, approximate distance, 1-2 fun facts in non-technical language
 - Info screen loads within 1 second (local data)
-

Feature: Search by Name

Priority: High

[STORY] As Rafael, an amateur astronomy enthusiast, I want to search for a specific celestial object by name - Story Point Estimate: 3 pts

As Rafael (amateur astronomy enthusiast), I want to search for a specific object by name, so that I can locate it even without blindly pointing the camera.

Acceptance Criteria:

- Search field with autocomplete from the local catalog
 - Result indicates direction/altitude in the sky to locate the object
-

Feature: Night Mode

Priority: High

[STORY] As Rafael, an amateur astronomy enthusiast, I want to enable night mode to preserve my night vision - Story Point Estimate: 2 pts

As Rafael (amateur astronomy enthusiast), I want to enable a red-toned screen mode, so that I don't lose my night vision while checking the app in the dark.

Acceptance Criteria:

- Night mode toggle accessible within 2 taps
 - All app screens respect the theme when enabled
-

Feature: Constellation Identification

Priority: Medium

[STORY] As Rafael, an amateur astronomy enthusiast, I want to identify constellations by pointing the camera - Story Point Estimate: 8 pts

As Rafael (amateur astronomy enthusiast), I want to see the outline and name of constellations when pointing the camera, so that I can recognize larger patterns in the sky, not just isolated objects.

Acceptance Criteria:

- Constellation outline is drawn connecting the visible stars on screen
 - Constellation name appears near the outline
-

Feature: Offline Mode

Priority: Medium

[TASK] Embed local celestial catalog - Story Point Estimate: 5 pts

Embed a basic catalog of celestial objects and constellations locally in the app (SQLite/JSON), enabling identification without an internet connection.

[STORY] As Beatriz, a science educator, I want to use the app without an internet connection - Story Point Estimate: 3 pts

As Beatriz (science educator), I want the app to work without internet, so that I can use it during field activities without signal.

Depends on: "Embed local celestial catalog"

Acceptance Criteria:

- Object identification works normally with the device in airplane mode
 - App only shows a warning if a specific feature requires internet (none in the MVP)
-

EPIC 2: Increment 1 - Deepen engagement and accessibility

Epic Hypothesis: Adding accessibility and engagement features increases retention among enthusiast users and expands the app's reach to underserved audiences, such as visually impaired users.

Note: Following an emergent backlog approach, these items are intentionally kept at a macro level. Detailed acceptance criteria and estimates will be defined during future refinement, closer to implementation.

Personas involved:

- Rafael (amateur astronomy enthusiast)
 - Visually impaired users (new segment)
-

Feature: Audio Accessibility

Priority: High (within Increment 1)

[STORY] As a visually impaired user, I want to enable sonic mode to explore the sky by audio

As a visually impaired user, I want the app to announce out loud the name of the object the camera is pointing at, so I can explore the sky through audio.
(To be detailed during future refinement)

Feature: Event Notifications

Priority: Medium

[STORY] As Rafael, an amateur astronomy enthusiast, I want to receive astronomical event notifications

As Rafael (amateur astronomy enthusiast), I want to be notified about upcoming astronomical events (meteor showers, eclipses, full moons), so I don't miss them.
(To be detailed during future refinement)

Feature: Compass Mode

Priority: Medium

[STORY] As Ana, a casual user, I want to use compass mode to locate off-screen objects

As Ana (a casual user, curious about the night sky), I want to see arrows indicating the direction of objects outside the camera's field of view, so I can locate them by turning my phone.
(To be detailed during future refinement)

Feature: Constellation Mythology

Priority: Low

[STORY] As Rafael, an amateur astronomy enthusiast, I want to view constellation mythology

As Rafael (amateur astronomy enthusiast), I want to read the mythological story behind each constellation, so I can enjoy a richer cultural context while observing the sky.

(To be detailed during future refinement)

Feature: Favorites

Priority: Low

[STORY] As Rafael, an amateur astronomy enthusiast, I want to save favorite celestial objects

As Rafael (amateur astronomy enthusiast), I want to save celestial objects as favorites, so I can quickly revisit them later.

(To be detailed during future refinement)

Feature: History

Priority: Low

[STORY] As Ana, a casual user, I want to view my identification history

As Ana (a casual user, curious about the night sky), I want to see a history of objects I've identified, so I can look back on my past discoveries.

(To be detailed during future refinement)

FUTURE BACKLOG (not prioritized / future product vision)

- Extended premium catalog
 - Login/account creation
 - Social media sharing
 - Satellite/ISS notification
 - Classroom mode for educators
 - Multiple languages
 - Simple/advanced explanation mode
-

DEFINITION OF READY (DoR)

An item is ready to enter a Sprint when:

- The story follows the "As a... I want... so that..." format and is clear to the whole team
 - Acceptance criteria are defined and understood
 - Technical dependencies (enablers) have been identified and, if possible, resolved beforehand
 - The item has been estimated by the team (story points)
 - There are no known external blockers (e.g., missing API, pending design decision)
 - The team understands the value/motivation behind the item (not just the "what," but the "why")
-

DEFINITION OF DONE (DoD)

An item is considered complete when:

- Code implemented and reviewed (code review) by another team developer
 - Acceptance criteria validated manually or through automated testing
 - Feature tested on at least 2 different devices/screen sizes
 - No known critical bugs or blockers
 - Minimal documentation updated (if applicable)
 - Build successfully generated, with no compilation errors
-

Non-Functional Requirements (part of the DoD)

- **Performance:** object identification responds within 2 seconds after pointing the camera
- **Usability:** main flow (open app → identify object) executable in a maximum of 3 taps
- **Reliability/Offline:** MVP features operate 100% without internet connection
- **Compatibility:** works on Android 10+ and iOS 15+ (covering at least 90% of active devices in the target audience)
- **Resource consumption:** camera + sensor usage should not cause excessive device heating during continuous sessions of up to 15 minutes

JIRA:

EPIC 1: MVP - Identify the sky in real time

< Voltar SKYLENS-1

MVP - Identify the sky in real time

Descrição

Deliver the minimum viable product that allows users to point their phone's camera at the night sky and instantly identify visible celestial objects and constellations, with basic informational content, name-based search, offline functionality, and a night mode for comfortable use in the dark.

Epic Hypothesis: Leaners users can identify celestial objects correctly within 30 seconds, without any prior astronomy knowledge, using only their phone's camera.

Success Metrics:

- ≥70% of users complete their first identification within 2 minutes
- ≥30% of users return to the app within 7 days
- App store rating ≥4.0

Personas involved: Ana (casual curious user), Rafael (amateur astronomy enthusiast), Beatriz (science educator)

Increment 1 - Deepen engagement and accessibility

+

...

Descrição

Extend the MVP with features that increase user engagement, retention, and inclusivity, including audio accessibility for visually impaired users, event notifications, and additional exploration tools (compass mode, constellation mythology, favorites, and history).

Epic Hypothesis: Adding accessibility and engagement features increases retention among enthusiast users (Rafael persona) and expands the app's reach to underserved audiences, such as visually impaired users.

Note: This epic's features are not fully refined yet - following an emergent backlog approach, detailed user stories will be broken down closer to implementation time.

Personas involved: Rafael (amateur astronomy enthusiast), visually impaired users (new segment)
